

Teaching goals: After completing, the student

- understands how the tableau method in predicate logic differs from propositional logic, can formally define all necessary concepts
- knows atomic tableaux for quantifiers, understands their use
- can construct a finished tableau for a given formula from a given (even infinite) theory
- can describe the canonical model for a given finished noncontradictory branch
- understands the axioms of equality, their relation to congruences, quotient structures
- can apply the tableau method to solve a given problem (word problem, etc.)
- understands tableau method for languages with equality, can apply to simple examples
- knows the compactness theorem of predicate logic, can apply it

IN-CLASS PROBLEMS

Problem 1. Assume that:

- *All guilty people are liars.*
- *At least one of the accused is also a witness.*
- *No witness lies.*

Prove by the tableau method that: *Not all the accused are guilty.* Specifically:

- Choose a suitable language \mathcal{L} . Will it be with equality, or without equality?
- Formalize our knowledge and the statement to be proved as sentences $\alpha_1, \alpha_2, \alpha_3, \varphi$ in \mathcal{L} .
- Construct a tableau proof of the sentence φ from the theory $T = \{\alpha_1, \alpha_2, \alpha_3\}$.

Problem 2. Consider the following statements:

- Zero is a small number.*
- A number is small iff it is close to zero.*
- The sum of two small numbers is a small number.*
- If x is close to y , then $f(x)$ is close to $f(y)$.*

We want to prove that: *(v) If x and y are small numbers, then $f(x + y)$ is close to $f(0)$.*

- Formalize the statements as sentences $\varphi_1, \dots, \varphi_5$ in $L = \langle M, B, f, +, 0 \rangle$ without equality.
- Construct a finished tableau from the theory $T = \{\varphi_1, \varphi_2, \varphi_3, \varphi_4\}$ with the item $F\varphi_5$ at the root. Decide whether $T \models \varphi_5$.
- If they exist, give at least two complete simple extensions of the theory T .

Problem 3. Consider the language $L = \langle c \rangle$ with equality, where c is a constant symbol. Using the tableau method prove that the formula $x = c$ is valid in $T = \{(\exists x)(\forall y)x = y\}$.

Problem 4. Let L be a language with equality containing a binary relational symbol \leq and let T be an L -theory such that T has an infinite model and the axioms of a linear order hold in T . Using the compactness theorem show that T has a model \mathcal{A} with an *infinite descending chain*; that is, in \mathcal{A} there exist elements c_i for every $i \in \mathbb{N}$ such that: $\dots < c_{n+1} < c_n < \dots < c_0$. (This implies that the notion of a *well-ordering* is not definable in first-order logic.)

EXTRA PRACTICE

Problem 5. Consider the following statements:

- Every professor has written at least one textbook.*
- Every textbook was written by some professor.*

- (iii) For every professor, someone is studying with them.
 (iv) Everyone who studies with some professor has read all textbooks by that professor.
 (v) Every textbook has been read by someone.
- (a) Formalize (i)–(v) as sentences $\varphi_1, \varphi_2, \varphi_3, \varphi_4, \varphi_5$ in $L = \langle N, S, P, D, U \rangle$ without equality.
 (b) Construct a finished tableau from $T = \{\varphi_1, \varphi_2, \varphi_3, \varphi_4\}$ with item $F\varphi_5$ at the root.
 (c) Is the sentence φ_5 true in the theory T ? Is it false in T ? Is it independent in T ? Justify.
 (d) Does the theory T have a complete conservative extension? Justify.

Problem 6. Using the tableau method, prove the following rules for ‘pulling out’ quantifiers, where $\varphi(x)$ is a formula with a single free variable x , and ψ is a sentence.

- (a) $\neg(\exists x)\varphi(x) \rightarrow (\forall x)\neg\varphi(x)$ (c) $((\exists x)\varphi(x) \rightarrow \psi) \rightarrow (\forall x)(\varphi(x) \rightarrow \psi)$
 (b) $(\forall x)\neg\varphi(x) \rightarrow \neg(\exists x)\varphi(x)$ (d) $(\forall x)(\varphi(x) \rightarrow \psi) \rightarrow ((\exists x)\varphi(x) \rightarrow \psi)$

Problem 7. Let $L(x, y)$ represent “there is a flight from x to y ” and $S(x, y)$ represent “there is a connection from x to y ”. Assume that from Prague one can fly to Bratislava, London, and New York, and from New York to Paris, and that

- $(\forall x)(\forall y)(L(x, y) \rightarrow L(y, x))$,
- $(\forall x)(\forall y)(L(x, y) \rightarrow S(x, y))$,
- $(\forall x)(\forall y)(\forall z)(S(x, y) \wedge L(y, z) \rightarrow S(x, z))$.

Prove using the tableau method that there is a connection from Bratislava to Paris.

Problem 8. Let T be the following theory in the language $L = \langle R, f, c, d \rangle$ with equality, where R is a binary relation symbol, f a unary function symbol, and c, d constant symbols:

$$T = \{R(x, x), R(x, y) \wedge R(y, z) \rightarrow R(x, z), R(x, y) \wedge R(y, x) \rightarrow x = y, R(f(x), x)\}$$

Denote by T' the general closure of T . Let φ and ψ be the following formulas:

$$\varphi = R(c, d) \wedge (\forall x)(x = c \vee x = d) \quad \psi = (\exists x)R(x, f(x))$$

- (a) Construct a tableau proof of ψ from $T' \cup \{\varphi\}$. (For simplicity, in the tableau you may directly use the axiom $(\forall x)(\forall y)(x = y \rightarrow y = x)$, a consequence of the equality axioms.)
 (b) Show that ψ is not a consequence of T by finding a model of T in which ψ is not valid.
 (c) How many complete simple extensions (up to \sim) does $T \cup \{\varphi\}$ have? Provide two examples.
 (d) Is the following theory S in $L' = \langle R \rangle$ with equality a conservative extension of T ?

$$S = \{R(x, x), R(x, y) \wedge R(y, z) \rightarrow R(x, z), R(x, y) \wedge R(y, x) \rightarrow x = y\}$$

FOR FURTHER THOUGHT

Problem 9. Prove syntactically, using tableau transformations:

- (a) *Theorem on Constants:* Let φ be a formula in the language L with free variables x_1, \dots, x_n and T a theory in L . Let L' be the extension of L with new constant symbols c_1, \dots, c_n and T' the theory T in L' . Then: $T \vdash (\forall x_1) \dots (\forall x_n)\varphi$ if and only if $T' \vdash \varphi(x_1/c_1, \dots, x_n/c_n)$
 (b) *Deduction Theorem:* For any theory T (in closed form) and sentences φ, ψ , we have: $T \vdash \varphi \rightarrow \psi$ if and only if $T, \varphi \vdash \psi$

Problem 10. Let T^* be a theory with equality axioms. Show using the tableau method that:

- (a) $T^* \models x = y \rightarrow y = x$ (symmetry)
 (b) $T^* \models (x = y \wedge y = z) \rightarrow x = z$ (transitivity)

Hint: For (a) use the equality axiom (iii) for $x_1 = x, x_2 = x, y_1 = y$ and $y_2 = x$,
 for (b) use (iii) for $x_1 = x, x_2 = y, y_1 = x$ and $y_2 = z$.
