NAIL062 P&P Logic: Worksheet 4 – The tableaux method

Teaching goals: After completing, the student

- knows terminology of tableau method (entry, tableau, tableau proof/refutation, finished/contradictory branch, canonical model), can define them formally, give examples
- knows all atomic tableaux and can create suitable atomic tableaux for any logical connective
- can construct a finished tableau for a given formula from a given (even infinite) theory
- can describe the canonical model for a given completed consistent branch of a tableau
- can apply the tableau method to solve a given problem (word problems, etc.)
- knows the compactness theorem and can apply it

In-class problems

Problem 1. Aladdin found two chests, A and B, in a cave. He knows that each chest contains either a treasure or a deadly trap. The chests have the following inscriptions:

- On chest A: *"At least one of these two chests contains a treasure."*
- On chest B: *"Chest A contains a deadly trap."*

Aladdin knows that either both inscriptions are true, or both are false.

(a) Express Aladdin's information as a theory T over a suitably chosen set of propositional variables $\mathbb{P}$. (Explain the meaning of each propositional variable in $\mathbb{P}$.)
(b) Try to construct tableau proofs from the theory T for the propositions "The treasure is in chest A" and "The treasure is in chest B".
(c) If any of these completed tableaux are consistent, construct the canonical model for one of its consistent branches.
(d) What conclusion can we draw from this?

Problem 2. Consider the infinite propositional theories (a) $T = \{p_{i+1} \to p_i \mid i \in \mathbb{N}\}$ (b) $T = \{p_i \to p_{i+1} \mid i \in \mathbb{N}\}$. Using the tableau method, find all models of T. Is every model of T a canonical model for some branch of this tableau?

Problem 3. Design suitable atomic tableaux for the logical connective $\oplus$ (XOR) and show that if a model satisfies the root of your atomic tableaux, it also satisfies some branch.

Problem 4. Using the compactness theorem, show that every countable partial order can be extended to a complete (linear) order.

Extra practice

Problem 5. During the interrogation of Adam, Barbara, and Cyril, it was established that:

(i) *At least one of the interrogated persons tells the truth, and at least one lies.*
(ii) *Adam says:* "Barbara or Cyril lie."
(iii) *Barbara says:* "Cyril lies."
(iv) *Cyril says:* "Adam or Barbara lie."

(a) Express statements (i)–(iv) as formulas φ_1–φ_4 over the set of propositional variables $\mathbb{P} = \{a, b, c\}$, where a, b, c respectively mean *"Adam/Barbara/Cyril tells the truth"*.
(b) Using the tableau method, prove that $T = \{\varphi_1, \ldots, \varphi_4\}$ implies that Adam tells the truth.
(c) Is the theory T equivalent to the theory $T' = \{\varphi_2, \varphi_3, \varphi_4\}$? Justify your answer.

Problem 6. Using the tableau method, prove that the following formulas are tautologies:

(a) $(p \to (q \to q))$
(b) $p \leftrightarrow \neg\neg p$
(c) $\neg(p \vee q) \leftrightarrow (\neg p \wedge \neg q)$
(d) $(p \to q) \leftrightarrow (\neg q \to \neg p)$

Problem 7. Using the tableau method, either prove or find a counterexample in the form of a *canonical* model for a consistent branch.

(a) $\{\neg q,\ p \vee q\} \models p$
(b) $\{q \to p,\ r \to q,\ (r \to p) \to s\} \models s$
(c) $\{p \to r,\ p \vee q,\ \neg s \to \neg q\} \models r \to s$

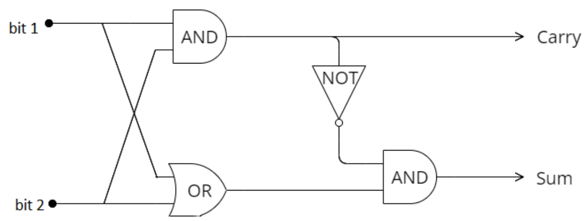
Problem 8. Using the tableau method, determine all models of the following theories:

(a) $\{(\neg p \vee q) \to (\neg q \wedge r)\}$
(b) $\{\neg q \to (\neg p \vee q),\ \neg p \to q,\ r \to q\}$
(c) $\{q \to p,\ r \to q,\ (r \to p) \to s\}$

Problem 9. Design suitable atomic tableaux and show that if a model satisfies the root of your atomic tableaux, it also satisfies some branch:

- for Peirce's connective $\downarrow$ (NOR),
- for Sheffer's connective $\uparrow$ (NAND),
- for $\oplus$ (XOR),
- for the ternary operator "if p then q else r" (IFTE).

Problem 10. A *half-adder circuit* is a logic circuit with two input bits (bit 1, bit 2) and two output bits (carry, sum) illustrated in the following diagram:



(a) Formalize this circuit in propositional logic. Specifically, express it as a theory $T = \{c \leftrightarrow \varphi,\ s \leftrightarrow \psi\}$ in the language $\mathbb{P} = \{b_1, b_2, c, s\}$, where the propositional variables mean "bit 1", "bit 2", "carry", and "sum", and the formulas φ, ψ do not contain the variables c, s.
(b) Using the tableau method, prove that $T \models c \to \neg s$.

Problem 11. Using the compactness theorem, prove that every countable planar graph is four-colorable. You may use the Four Color Theorem (for finite graphs).

For further thought

Problem 12. Prove directly (by transforming tableaux) the *deduction theorem*, i.e., that for any theory T and formulas φ, ψ, we have:

$$T \vdash \varphi \to \psi \text{ if and only if } T, \varphi \vdash \psi$$

Problem 13. Let A and B be two non-empty theories in the same language. Suppose that every model of theory A satisfies at least one axiom of theory B. Show that there exist finite sets of axioms $\{\alpha_1, \ldots, \alpha_k\} \subseteq A$ and $\{\beta_1, \ldots, \beta_n\} \subseteq B$ such that $\alpha_1 \wedge \cdots \wedge \alpha_k \ \to\ \beta_1 \vee \cdots \vee \beta_n$ is a tautology.
